

Abhishek Guleria

+91-9988757891 | Gurugram, Haryana, India | abhishek.guleria7@gmail.com

SUMMARY

Experienced engineer with a demonstrated history of working in the information technology and services industry. Experienced in the processes of Big Data Eco system, Data Science and Business enhancements in a project. Driven by passion, enthusiasm, and a flair for knowledge on how things work helps me deliver the best in any given project under any domain.

EDUCATION

Lovely Professional University | Bachelor of Technology in Computer Science and Engineering

August 2015 - July 2019

SKILLS

Programming Languages: Python, Scala, SQL and Pyspark.

Big Data: Hadoop, SQOOP, Hive, Apache Spark, Databricks, Airflow, DBT, Snowflake and Kafka.

Data Science: Data Cleaning, Exploratory Data Analysis (EDA), Data Visualization.

Machine Learning: Regression Techniques (Linear Regression, L1/L2 Regression), Classification Techniques (Logistic Regression, Naïve Bayes Classifier, Decision Trees. Ensemble Techniques

Cloud Platform: AWS & GCP

Databases: PostgreSQL, Oracle, MySQL and Cassandra.

IDE: VS Code, IntelliJ IDEA, PyCharm.

OS: Ubuntu, CentOS, MacOS, Windows.

Source control: Bitbucket.

WORK EXPERIENCE

Software Development Engineer – 2(Data) | ZEE5 (OTT)

Aug 2022- Till Date

- The main aim of the pipeline is to take raw data as input and process it into transformed data. The goal is to ensure that subscription data is accurately populated in the Subscription table. This transformed data is then made available for use by the Data Science team for reporting purposes or for building machine learning (ML) models. By processing and transforming the raw data, the pipeline ensures that the Subscription table contains reliable and usable data, enabling the Data Science team to leverage it effectively for their analytical and modeling needs.
- Worked on building a pipeline focused on analyzing user behavior within the ZEE5 application. This pipeline aims to determine the duration of user engagement, identify preferred content and genre types, and gather information on the cast members associated with popular content. The pipeline is designed to provide valuable insights into user preferences, viewing habits, and popular content on the ZEE5 platform.
- Contributed to the cloud migration from AWS to GCP.

Senior Data Engineer | The Smart Cube

Nov 2021 – Aug 2022

- The objective was to create Invoice Data so that client can offer various offers to their customers.
- Analyzed the data stored in Google Big Query and 3rd Party data, containing the customers information, their purchase history, subscription plans, sales data etc.
- Client wanted to create MRR report based on Invoice Data.
- Migration of Data from SQLite to PostgreSQL and have automated data migration process, the frequency is monthly.

Data Engineer | Wipro Ltd

Jan 2019 –Nov 2021

- Extract data from various data sources and loading, cleansing and transforming the data.
- Development of Data in the Data lake by ingestion, cleansing and processing data to create canonical models.
- Developed Spark code in Pyspark using Spark SQL & Data Frames.
- Utilize my Python and SQL expertise to design, test, document, deploy and maintain program to meet individual client requirement in accordance with SDLC standards and guidelines.
- Performance tuning of Spark queries and have implemented Data Quality checks.
- Conduct data cleaning, manipulation, modification and combination using variety of steps and functions.
- Worked closely with business and Data Science teams to encourage statistical best practices with respect to experimental design, data capture and data analysis.

ZEE5 User Behavior and Content Analysis Pipeline

The objective is to build a pipeline that can analyze user behavior within the ZEE5 application. The pipeline aims to determine how long a person stays in the ZEE5 application and gather insights on the content and genre types that users are most interested in consuming. Additionally, the pipeline will identify the cast members associated with the content that users are engaging with. By collecting and analyzing this data, valuable insights can be derived regarding user preferences, viewing habits, and popular content on the ZEE5 platform.

Developed a pipeline to handle the subscription data

The objective of the pipeline is to extract and process incremental subscription data before loading it into staging and master tables. We utilize AWS Glue Data Catalog to store the table metadata and Hive as a warehouse for querying the data with Amazon Athena. Airflow is used to schedule the daily execution of the ETL procedure. The dataset is utilized to create various Data Science use cases.

In-house Audience Builder for Zee Platform

Part of in-house Audience Builder for AdTech, MarTech, and CLM on top of Data Lake. Handled over 100 million users. The system provides audience creation through segmentation and a rule-based engine (recency and frequency basis). Fresh data availability to end systems (Ad server and CLM tool) hourly. Developed Audience Builder Spark Pipeline.

Appsflyer

Appsflyer allows us to easily measure the performance of all the zee5 channels -paid, organic and social, for marketing campaigns across million users.

Implemented Big Data Lake for Healthcare client

Implemented Data Loader, Data Validation and Data Transformation/cleaning stages.

Extracted Data from Multiple sources like API, Databases and raw data stored into Data Lake.

Layered Data Architecture follows consideration; File System, Logical structure, Physical structure and File formats.

Factors considered for Data Validation; File formatting, check schema, number of columns, check nulls, move bad records in Rejected directory and many others.

Rejected directory stores failed records while performing checks between RAW to cleansed data.

Customized data pipelines as per business requirements.

Effectively onboarded 6400+ users and implemented various use cases in data lake platform.

Implemented Invoice Data for MRR report

Extracted Data from multiple sources 3rd party Chargebee and data stored in Google big Query.

Implemented Invoice Data by using Chargebee and Big Query data. Optimized Data Pipeline by reducing time from 1 hour 15 mins to 20-23 mins.

Other Tasks:

- Compiled, cleaned and manipulated data for proper handling.
- Developed, implemented, supported and maintained data analytic protocols, standards and documentation.
- Analysed complex data and identified anomalies, and risks to provide useful insights to improve internal controls.
- Designed and developed Data Pipelines and analytically data structures.
